

Time with antibiotics is running out.

Due to antibiotic misuse, more than 2.8 million antibiotic-resistant infections occur annually—killing more than 35,000 Americans.¹

It's time to ACT.

As of Spring 2020 CMS requires:

"A hospital's infection prevention and control and antibiotic stewardship programs will be **active and hospital-wide** for the surveillance, prevention, and control of [hospital acquired infections] and other infectious diseases, and for the **optimization of antibiotic use** through stewardship."

Take action today. **Get the test right.** **Kurin Lock[®], with Flash Technology,** **is simply better than conventional diversion.**

Blood culture tests inform critical care decisions, including antibiotic administration. But, contamination causes false positive results in nearly 1/3 of all positive cultures.

The Kurin Lock[®] is a passive device that sidelines skin contaminants with no change in collection technique.

"The global community needs more innovation, new treatment options, reliable diagnostics and better data that will help protect people."

--CDC Director
Robert R. Redfield, MD.

Are you **ACTIVELY** avoiding antibiotic misuse?

Make Kurin part of your plan to reduce contaminated blood cultures that lead to unnecessary antibiotic use.
